

ECE3040: Table of Contents

Lecture 1: Introduction and Overview

- Instructor contact information
- Navigating the course web page
- What is meant by numerical methods?
- Example problems requiring numerical methods
- What is Matlab and why do we need it?

Lecture 2: Matlab Basics I

- The Matlab environment
- Basic arithmetic calculations
- Command Window control & formatting
- Built-in constants & elementary functions

Lecture 3: Matlab Basics II

- The assignment operator “=” for defining variables
- Creating and manipulating arrays
- Element-by-element array operations: The “.” Operator
- Vector generation with linspace function and “:” (colon) operator
- Graphing data and functions

Lecture 4: Matlab Programming I

- Matlab scripts (programs)
- Input-output: The input and disp commands
- The fprintf command
- User-defined functions
- Passing functions to M-files: Anonymous functions
- Global variables

Lecture 5: Matlab Programming II

- Making decisions: The if-else *structure*
- The error, return, and nargin commands
- Loops: for and while *structures*
- Interrupting loops: The continue and break commands

Lecture 6: Programming Examples

- Plotting piecewise functions
- Computing the factorial of a number
- Beeping
- Looping vs vectorization speed: tic and toc commands
- Passing an “anonymous function” to Matlab function

- Approximation of definite integrals: Riemann sums
- Computing $\cos(x)$ from its power series
- Stopping criteria for iterative numerical methods
- Computing the square root
- Evaluating polynomials
- Errors and Significant Digits

Lecture 7: Polynomials

- Polynomials in engineering
- Matlab numeric tools for polynomials
- Matlab symbolic tools for polynomial and other analytic functions

Lecture 8: Taylor Series Approximations I

- The Taylor series: Taylor function
- Taylor series expansion for some basic functions
- Evidence of digital machine truncation error
- Elementary function computation using Taylor series
- Rearrangement of formulas to control the round-off error
- Significance of the Taylor series expansion point a

Lecture 9: Taylor Series Approximation II

- Taylor series generation of approximate *analytic* solutions
- The Gaussian integral and its polynomial approximations
- Taylor series-based solution of nonlinear equations
- Padé approximation: Approximation with a rational function

Lecture 10: Digital Machine Round-off Errors

- Total error in a numerical method
- Round-off error in the evaluation of simple formulas
- Binary floating-point representation of numbers
- The source of round-off errors
- Truncation error vs round-off error in numerical differentiation

Lecture 11: Numerical Solution of Nonlinear Equations I

- Introduction and problem formulation
- Graphical method for estimating solutions
- Taylor series-based method: The `solve_poly` function revisited
- Fixed-point iteration method: Single equation
- Fixed-point iteration method: System of equations
- Solving for complex roots
- Appendix: Convergence rate of the fixed-point method

Lecture 12: Numerical Solution of Nonlinear Equations II

- Newton's method

- Convergence analysis of Newton's method
- Secant method
- Newton's method for solving a system of equations
- Bisection method
- Matlab built-in numerical solver: fzero and fsolve
- Matlab built-in *symbolic* solver: solve
- Comparison of the different root finding methods
- Appendix: Proof of the quadratic convergence of Newton's method

Lecture 13: Optimization I

- Introduction and motivation
- Extreme points: Maxima, minima and inflection
- Polynomial optimization: The optm_poly function
- Application of numerical root-finding methods to optimization
- Golden-section search for maxima/minima

Lecture 14: Optimization II

- Parabolic interpolation
- Parabolic interpolation-based optimization
- Matlab's built-in optimization function: fminbnd
- Gradient-based optimization method
- User-defined functions grad_optm1 and grad_optm2

Lecture 15: Systems of Linear Equations I

- Examples of systems of linear equations: Formulation and solution
- Graphical representation: Singular and ill-conditioned systems
- Gauss elimination: Function gauss
- Pivoting: Function guass_pivot

Lecture 16: Systems of Linear Equations II

- LU factorization and the solution of linear algebraic equations
- Matlab's lu function and the left-division operator: \
- More on Matlab's left-division operator
- Iterative methods: Jacobi and Gauss-Seidel algorithms

Lecture 17: Polynomial Interpolation

- Introduction
- Interpolation using a single polynomial
- Newton's interpolation polynomials
- Matlab built-in polynomial interpolation: polyfit
- The curse of high-dimensional polynomials
- Cubic spline interpolation

- Matlab built-in cubic spline interpolation: spline
- Interpolation using rational functions

Lecture 18: Curve Fitting by Least-Squares Regression

- Introduction
- Linear least-squares regression and the straight line model
- Linearization of nonlinear models
- General linear least-squares regression and the polynomial model
- Polynomial regression with Matlab: polyfit
- Non-linear least-squares regression
- Numerical solution of the non-linear LSE optimization problem: Gradient search and Matlab's fminsearch function

Lecture 19: Numerical Integration I

- Introduction
- Numerical integration formulas:
 - Simple integration: Approximation with a constant
 - Midpoint rule: Another approximation with a constant
 - Trapezoidal Rule: Approximation with a straight line
 - Simpson's 1/3 Rule: Approximation with a parabola
 - Simpson's 3/8 Rule: Approximation with a 3rd-order polynomial
- Matlab built-in numerical integration from data points: trapz
- Numerical integration applied to generating Chebyshev power series

Lecture 20: Numerical Integration II

- Introduction
- Richardson extrapolation & Romberg integration
- Gauss quadrature: Two-point Gauss-Legendre formula
- Adaptive quadrature
- Matlab numerical integration functions quad & quadl (or integral)
- Matlab polynomial and symbolic integration: polyint and int
- Taylor series-based integration
- Multiple integrals: dblquad (integral2) and triplequad (integral3)
- Monte Carlo integration

Lecture 21: Numerical Differentiation

- Introduction
- Differentiation formulas
- Richardson extrapolation
- Matlab numerical differentiation functions: diff
- Matlab polynomial and symbolic differentiation: polyder and diff

Lecture 22: Numerical Solution of Differential Equations

- Introduction

- Euler's method for solving first-order ODEs
- Euler's method for higher-order ODEs
- Error analysis of Euler's method
- Improving Euler's method: Heun's & Runge-Kutta methods
- Matlab's function ode45
- Case study: Bungee jumper
- Appendix: Symbolic solution of ODE's using Matlab's dsolve

Appendix A: Numerical Solution of Some Interesting Systems of ODEs

- Hanging Two-Mass, Two-Spring Linear (Ideal) System
- Tunnel Diode Circuit
- The (Diffusion-less) Lorenz Dynamical System
- Euler's Restricted Three-Body Problem
- The General (Planar) Three-Body Problem
- Extremizing Functions: The suspended chain and other problems

Appendix B: Summary of User-Defined and Built-in Matlab Functions

Appendix C: The 10 Most Important Matlab Functions for Numerical Methods

Appendix D: Numerical Methods and Vintage Programmable Calculators
